

EMV countertop terminals

The future is now

Credit and debit card technology, and the methods of accepting card payment, is rapidly changing. EMV is being deployed to reduce the level of card fraud and to keep sensitive card data more secure. Other technologies such as NFC are enabling terminals to make a quick and convenient contactless payment instead of relying on the traditional card swipe. Sage has the expertise to assist you in deciding what makes sense for your business. And Sage offers you a choice of technically advanced terminals that support these payment options while retaining the reliability, and ease of use that are important to you and your customers.

Secure payment processing

EMV, an abbreviation for Europay, MasterCard®, and Visa®, is a global standard for card acceptance. EMV credit and debit cards add a secure microchip to the front of the card while retaining the legacy magnetic strip on the back of the card. During a payment transaction the card remains inserted in the terminal, and the microchip adds an additional layer of security, reducing the level of fraud due to the use of counterfeit cards. Sage offers several terminals that support EMV now so that your business is ready as EMV cards become widely deployed.

Tap to pay

Traditional contactless payment methods like payWave (Visa®), PayPass (MasterCard®), and ExpressPay (American Express®) enabled by NFC are now being joined by new services such as Apple Pay.™ These methods of “tap and pay” are becoming popular with customers, as it can speed up the checkout process. Whether you choose to support contactless payments now or in the future, these terminals are ready when you are.

Benefits

- You can maximize the value of your equipment investment by supporting emerging technologies like EMV and NFC
- Reliable, easy -to-use terminals that support your critical payment needs
- Improved customer satisfaction by offering a secure, convenient method of card payment they want to use
